No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 6, App

C;Comment: The precursor is synthesized in the liver and small intestine. The propeptid C;Comment: ApoA-I makes up about 70% of the procein of the high density lipoproteins (H) y promoting cholesterol efflux from tissues and by acting as a cofactor for the lecithin C;Genetics:

L Electrophoresis 18:2795-2802(1997).

-!- FUNCTION: Participates in the reverse transport of cholesterol from tissues to the liver for excretion by promoting cholesterol efflux from tissues and by acting as a cofactor for the lecithin cholesterol acyltransferase (LCAT).

-!- SUBCELLULAR LOCATION: Secreted.

-!- SUBCELLULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Major protein of plasma HDL, also found in chylomicrons. Synthesized in the liver and small intestine.

-!- SIMILARITY: Belongs to the apolipoprotein Al/A4/E family.
                                                                                                                                                                                                                                                                                                             MEDLINE=82142425; PubMed=6801039;

AAA89634 and AAR72705 depict the AA sequence of human apo A-I and its corresp. CDNA, including presignal residues and propeptide residues. according to Seilhamer et al., DNA 3(1:309 (1984). A dispersible apo A-I/B-100 fusion polypeptide is claimed which contains a first AA sequence of apo A-I and that includes at least AA sequence positions 120-135 (see AAR72606) and which reacts with pan anti-apo AI antibodies such as: AI-4 ATCC HB8744; AI-7 ATCC HB 8745; AI-9 ATCC HB 8741; AI-10 ATCC HB 9200; AI

Polypeptides specifically claimed include residues 217-297, 216-310, 216-331, 216-327, 2177, 1-377, 205-297, 173-297, 140-297. DNA sequences encoding the polypeptides are also claimed. Also claimed are a fusion polypolypeptide that contains: (a) a first amino

                                                                                                                             Domain
                                                                                                                                                     Domain
                                                                                                                                                                             Domain
     The present invention describes a nucleic acid (A) encoding an apolipoprotein A-1 (apoA-1) agonist (B) that is a peptide, or analog, which forms an amphipathic alpha-helix in presence of lipids. (A), optionally as a complex with lipids, and host cells that contain (A), are useful for gene therapy, or prevention, of diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenoiss, HDL (high density lipoprotein) and apoA-1 deficiency, hypertriglyceridemia and metabolic syndrome, also to treat endotoxemia (septic shock). Host cells containing (A) can also be used to study the role of apoA-1 in lipid metabolism. (B) can also be used to study the role of apoA-1 in lipid metabolism. (B) can be used diagnostically, e.g. to measure serum HDL (particularly its subpopulation involved in retrograde cholesterol transport) and for imaging the circulatory system or HDL accumulations at fatty streaks. The present sequence represents human apoA-1
                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                                                                                                                                                                                                                180

This sequence shows full length apolipoprotein (Apo-Al). Fragments of Apo-Al may be used as Apo-A-I fragment T-cell activation inhibitors (AFT1). These fragments are selected from an 18 KD N-terminal fragment (amino acids 25-194), a 13 KD N-terminal fragment (amino acids 25-194), a 13 KD N-terminal fragment (amino acids 25-194) and a 13 KD C-terminal fragment (amino acids 25-194) and a 13 KD C-terminal fragment (amino acids 25-194) and a 13 KD C-terminal fragment (amino acids 15-267). The AFTI polypeptides and polynucleotides are useful for regulating T-cell mediated activation of monocytes and for treating, diagnosing, ameliorating diseases associated with IL-1 and/or TNF activity. The diseases are acute pancreatitis, Alzheimer's disease, asthma, cancer, fever, inflammatory bowel disease, ischemia, multiple sclerosis, osteoporosis, Parkinson's disease or psoriasis. Numerous examples of other diseases are given in the specification. The AFTI nucleic acids are useful as hybridization probes in diagnostic assays to test for the presence of an AFTI or Apo-A-I DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Apo-A-I fragment T-cell activation inhibitor (AFT1) polynucleotides, useful for treating, diagnosing, ameliorating diseases associated with IL-1 and/or TNF activity, e.g. acute pancreatitis, Alzheimer's disease and

The invention specifically relates to detecting the region of a cytochrome Coxidase subunit VID (COXEB) gene that is associated with high serum cholesterol, or the region of the Nacetylglucosaminyl transferase component glycosylphosphatidylinosticl-1 (GPL-1) gene that is associated with low serum high density lipoprotein (HDL). The methods of the invention are useful for detecting a predisposition to high serum cholesterol, low serum HDL and cardiovascular disease. The methods are also useful for elucidating pathological pathways, developing diagnostic assays and new drug therapies for such disorders. The present amino acid sequence represents

analogue or variant, and X is heterologous group e.g., amino acid, peptide, protein, carbohydrate or a nucleic acid, providing that when (I) consists of exactly two identical, native apolipoproteins these are inked serially. (I) is useful for preparing a pharmaceutical composition which further comprises excipients, adjuvants, additives, such as phospholipids, cholesterol or triglycerides. (I) is useful or treating and/or preventing arteriosclerosis, for removing endotoxins, for treating and/or preventing alteriosclerosis, for removing endotoxins, for treating and or preventing plaque or unstable angina pectoris, myocardial infarction, arterial stenoses such as claudicatio, carotis srenosis.

C cerebral arterial stenoses such as claudicatio, carotis srenosis, cerebral arterial stenoses such as claudicatio, carotis srenosis, correbral arterial stenoses such as claudicatio, carotis srenosis.

C cerebral arterial stenoses such as claudicatio, carotis srenosis, correbral arterial stenoses and or unstable of a cerebral attenial genome for interespondance of a native apoA-1, A-11 or A-1V, preferably two times higher or more preferably 10 times higher than the half-life of the compared to native apoA-1, A-11 or A-1V, (I) causes substantially no immune response in humans. This is the amino acid sequence of a human

The invention relates to a mutation of the apolipoprotein A-I (ApoA-I) comprising a leucine to proline variant in position 178. The mutant ApoA-I polynucleotide is useful for preparing a composition for treating cardiovascular disorder. The present sequence represents a human ApoA-I
                                                                                                                                                                                                                                                                                                                                                                                                                                                          ALGKOLNLKLLDNWDSVTSTFSKLREQLGPVTQEFWDNLEKETEGLRQEMSKDLEEVKAK 120

The present invention describes a nucleic acid (I) comprising a nucleotide sequence encoding an inhibitor of a pro-atherogenic molecule operationally linked to a macrophage-specific expression element. Also described: (I) a vector (II) comprising (I); (2) an embryonic stem cell (III) comprising (I); (3) an isolated mammalian cell (IV) comprising (I); (4) a recombinant cell (V) comprising a macrophage expressing nucleic acid encoding an inhibitor of a pro-atherogenic molecule; (5) a transgenic non-human mammal (VI) comprising recombinant cells containing a transgenic nucleic acid encoding an inhibitor of a pro-atherogenic molecule; and (6) a non-human mammalian cell (VII) isolated from (VI).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (I) has antiatherosclerotic activity and can be used in gene therapy. (I) or (V) can be used for inhibiting or reducing atherosclerosis, by administering to an individual (I) or apopulation of (V), where the population of (V) is derived from leukcytes, monocytes, macrophages or stem cells. (V) or (VI) is useful to screen for a drug potentially effective for treating atherosclerosis. (V) is useful for identifying a compound that reduces susceptibility to developing atherosclerosis. (V) is useful for identifying a neglul for determining the role of an inhibitor of pro-atherogenic model for atherosclerosis used in drug developing to condition of an animal model for atherosclerosis used in drug development. The present sequence represents human apolipoprotein (APOAI), which is given in the
                                                                                                                                                                                                                                                                                        Novel nucleic acid useful for inhibiting or reducing atherosclerosis, comprises nucleotide sequence encoding an inhibitor of a pro-atherogenic molecule operationally linked to a macrophage-specific expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Page 95; 99pp; English.

The invention discloses a apolipoprotein A-I (apo-A-I) polypeptide or its related polypeptide, apo-A-I fragment T-cell activation inhibitor-like (AFTI) polypeptide, or a fragment or an allelic or splice variant. Apo-A-I and its derivatives are used in regulating T-cell-mediated activation of monocytes. Also disclosed is an antibody produced by immunising an animal with apo-A-I and a selective binding agent, or its fragment. Apo-A-I is useful for reducing inflammation, interleukin (IL) labeta secretion or trumour necrosis factor (TNP)-alpha secretion in a subject, or for compositions of the invention are useful for treating (e.g. gene compositions of the invention are useful for treating (e.g. gene charapy), preventing or ameliorating a medical condition involving monocyte activation in a patient, for determining whether a compound inhibits activity or production of apo-A-I, for detecting or quantifying the amount of apo-A-I in a sample, for requlating T-cell-mediated conting AFTI receptors, and estable conting AFTI receptors, and estable conting AFTI receptors, and as an immunogen to raise antibodies, for treating acute and chronic IL-1 mediated diseases such as acute pancreatitis, Alzheimer's disease, content diseases such as depression, pancreatitis, and acute and chronic TNF-mediated diseases such as depression, pancreatitis, and acute and chronic TNF-mediated diseases such as depression, pancreatitis, and acute pancreatisis, reperfusion injury, theumatic and chronic and chronic TNF-mediated diseases such as depression, pancreatitis, and each and chronic and chronic and chronic and particular and are and chronic and chronic and chronic and chronic and acute and chronic and chronic and chronic and chronic and chronic and acute and chronic and chronic and acute and chronic and acute and chronic and acute and chronic and acute and acu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New apolipoprotein A-I polypeptide or its related polypeptide termed apo-
A-I fragment T-cell activation inhibitor-like polypeptide, useful for
treating interleukin-1 or tumor necrosis factor-alpha mediated disease.

They are also useful for regulating expression and modulating levels of apo.A-1, as hybridisation probes in diagnostic assays, for diagnostic applications, to test for the presence of apo.A-1 in cells, for in vivo imaging and in therapeutics. The sequence presented is the human apo.A-1 protein which comprises an 18K N-terminal or 13K N- or C-terminal fragments of the apo.A-1 protein.

The invention relates to a novel isolated NOVX polypeptide. The polypeptide demonstrates cytostatic, antiarteriosclerotic, antidiabetic, antialtathmatic, antiallergic, antialfalmamatory, respiratory.

antiarthmatic, dermatological, antibacterial, cerebroprotective, cardiant, haemostatic, hypotensive, hepatotropic, vasotropic, cardiant, haemostatic, hypotensive, hepatotropic, immunosuppressive, gynaecological, antibacterial, endocrine, immunosuppressive, gynaecological, antiparkinsonian, anticonvolsant, tranquiliser, analgesic, nephrotropic, antinfertility and antilipaemic crimquiliser, analgesic, nephrotropic, antinfertility and antilipaemic activities. The NOVX polypeptide, nucleic acid or antibody of the cativities are cardiomyopathy, atherosoclerosis, diabetes or a disorder related to cell signal processing and metabolic pathway modulation.

Contrementing diseases such as asthma, allergies, emphysema, autoimmune disease, graft-versus-host disease, arthritis, cancer, stroke, heemophilia, obesity, Alzheimer's disease and pain. The nucleic acids may be useful nof the invention which is related to human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New NOVX polypeptides and nucleic acid molecules, useful for diagnosing, preventing or treating NOVX-associated polypeptide disorder, e.g. cardiomyopathy, atherosclerosis, diabetes, cancer, Parkinson's disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 ALGKOLNIKLLDNWDSVTSTFSKLREQLGPVTQEFWDNLEKETEGIRQEMSKDLEEVKAK 120

The invention relates to a method for screening genes involved in aging and/or aging-associated diseases (AAD) or in oxidative stress. The method involves mutating and cultivating a yeast cell, enriching the population for mother cells, labelling the mother cells and isolating the highly labelled cells. The present sequence is human APOA1 protein. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ALGKOLNIKILIDNMDSVTSTFSKIREQIGPVTQEFWDNI.EKETEGIRQEMSKDI.EEVXAK 128
